

Enigma beta release software

The software installed in your Enigma is at beta release status. This status is expected to last from initial release date 18/9/2006 to 15/11/2006. Beta release software is identified by a version number with the first digit being a zero, for example 0.1.0.0.

Please check on our website regularly for latest updates. These are easy to download due to small size. Installation is simple: The file you download is in a ZIP library. Extract the file "Enigma.bin" from this library and copy to a SD card that has been formatted either as FAT16 or FAT32. The file should be copied to the route folder, i.e. not into a directory (folder). Insert the SD card into your Enigma instrument and switch the instrument on. Enigma will install the new software without any interaction required from your side.

Please note, depending on the type of software being upgraded on your Enigma, the screen may go dark for up to about one minute. Do not remove power during this time, allow the installation to complete.

Status of the Enigma support programs on the CD:

a) Enigma simulator and screen designer

Beta status, fully operational except for engine only script library file generation.

b) Enigma flight planner

Pre-beta status. Currently used only for import of waypoint data. Obtain waypoints for your area from www.navaid.com in GPX format. You can then import the GPX data using Enigma flight planner and convert to the Enigma waypoint.ewd file for use with your instrument.

Enigma flight planner also creates the airports.ewd file that contains airport information such as runway and frequency information.

Install both files into your Enigma using the import functions available in your common tasks menu.

Flight planner can at this stage also be used to create route files for use with Enigma and you can maintain your waypoint database.

c) Enigma voice recorder

Beta status, fully operational. You can use this program to create your own voice alarm words and phrases. Import the generated file "sounds.esd" into your Enigma using the relevant function in the "System initialization menu" (last menu in "System setup").

d) Enigma map maker

Beta status, fully operational. Use this program to convert any map image in BMP or JPG format into Enigma map files. Use commonly available image converters to convert into one of these formats for other image file formats.

Copy any generated map files plus the generated Mapindex.MM0 onto your SD card. These files are not installed onto your Enigma but remain on the SD card for use by Enigma.

e) Enigma flight log

This program is not yet available. This program will be used to store your Enigma flight log for viewing or printing on your PC.
